CHAPTER 1: Introduction

In the modern fast-paced digital world, financial management is a skill that individuals need to have. However, people face difficulties in managing their expenses, budgets, and making sound financial decisions. This is because they lack the appropriate tools and information. To overcome these problems, we have developed a comprehensive and intelligent tool for the management of individual finances, termed AI Finance Tracker.

The application includes a number of financial management tools in a single platform. Some of the tools include user authentication, expense tracking, budget management, EMI tracking, and report management. In addition, the application includes a financial advisor chatbot that provides users with appropriate financial advice through artificial intelligence.

The application provides a combination of traditional financial tracking tools with modern artificial intelligence tools.

1.1Motivation:

The motivation behind the development of the AI Finance Tracker comes from the increasing need for more intelligent and user-friendly financial management tools. This is because most existing tools lack a user-friendly interface and may not offer intelligent insights, which makes it difficult for users to comprehend the importance of using the tool for efficient financial management.

Motivating Factors:

Lack of Financial Awareness: Many people lack awareness about the importance of tracking their spending habits, which affects the way they plan their finances.

Multiple Tools: Existing tools offer different interfaces for managing budgets, EMI, and other financial needs, which makes it difficult for users to access all the tools in a single place.

Limited Personalization: Existing tools lack the ability to offer personalized insights to the users.

Increased Popularity of AI Technologies: The increased popularity of AI technology motivated the development of the AI Finance Tracker because it is now possible to offer real-time personalized insights using AI.

1.1.1 Objective:

The primary objective of the AI Financial Assistant is to design and develop an integrated, user-friendly, and intelligent financial management system. The specific objectives of the project are:

- Develop a secure authentication system that allows users to register and log in safely while ensuring data privacy and protection.

- Implement an efficient expense tracking system to record, categorize, and monitor daily financial transactions in an organized manner.

- Create a budget planning module that helps users set financial goals, control spending, and manage income effectively.

- Design an EMI tracking feature to monitor loan details, calculate monthly payments, and track due dates and outstanding balances.

- Provide interactive report dashboards that visualize financial data through charts and summaries for better understanding and analysis.

- Integrate an AI-based financial advisor chatbot to offer personalized financial advice, spending insights, and intelligent recommendations.

- Enhance financial awareness and decision-making by delivering meaningful, data-driven insights that help users improve their financial habits.

The goal of the AI Financial Assistant is to simplify the management of personal finances through the use of intelligent analysis with the help of the user's financial information.

1.1.2 Key Features:

The key characteristics of the AI-based financial assistant system:

- Gathering of user financial data like income, expenses, loan details, etc., through automation and storing the data for efficient tracking.

- Management of user financial data in a well-organized manner for efficient analysis of the data.

- Intelligent analysis of user spending habits using basic AI concepts for efficient financial analysis.

- Implementation of the basic financial management modules like expense tracking, budgeting, EMI calculation, etc.

- Implementation of a well-explained AI-based recommendation system for efficient user recommendations.

- Generation of the output in a well-structured manner through the integration of dashboards and report generation for efficient visualization of the output.

The AI-based financial assistant system shows the efficient utilization of modern technologies like AI systems for the development of a comprehensive financial management system. It is a practical system that shows the strong foundation of the development of advanced personal financial management systems for efficient decision-making in the daily lives of the users.

CHAPTER 2: Existing Work in AI Financial Assistant / Literature Review

Financial management has undergone a significant transformation with the development of digital technologies. This has resulted in the development of a number of personal financial management tools. This chapter discusses the existing tools, literature, and methodologies related to expense management, budgeting, and AI-based financial advisory systems.

2.1 Personal Finance Management Applications

There are some personal finance management applications like Mint, YNAB (You Need a Budget), and Pocket Guard, etc., that have been popular among people for their ability to help users track their income and expenses. These applications offer features like expense categorization, bill reminders, and budget allocation. They enable users to connect their bank accounts and import transactions, thus saving time.

However, the majority of these systems mainly deal with the tracking and reporting of the data. They may not offer much deeper insights into the spending habits of the users. In addition, some applications may be region-specific and may not be helpful for users in developing countries.

2.2 Budget Planning and Expense Tracking Systems

Traditional budget planning systems generally aim to help users manage the allocation of their income towards different expenses such as food, rent, transport, etc.

According to research studies, tracking expenses is a highly beneficial factor to ensure greater financial discipline and saving habits.

Most traditional systems require users to enter their expenses manually, which is generally a tedious process with a high chance of human error. Additionally, the systems do not have any predictive features to help users with suggestions to optimize their planning.

2.3 EMI and Loan Management Tools

In the context of the increased usage of loans and credit facilities, the concept of EMI (Equated Monthly Installment) tracking has emerged as a crucial component in the development of various tools and applications. In some tools and applications, EMI calculation and payment reminders are provided.

However, the overall approach to the development of tools and applications has not been comprehensive in terms of the integration of EMI tracking, and the user may not be able to obtain a comprehensive view on the overall implications of loan repayment.

2.4 Data Visualization and Financial Dashboards

Financial applications have become more modern and have incorporated dashboards that help users understand the data through charts, graphs, and other data visualization techniques. Using a pie chart

to display the distribution of expenditure and a line graph to display the trend in income helps users understand their financial position better.
Although the dashboards have improved the user experience, they are still limited to being descriptive in nature. Dashboards show the user what has happened but do not offer any insights into what happened and what needs to be done. This emphasizes the need for developing intelligent systems.

2.5 AI-Based Financial Advisory Systems

The recent advancements in Artificial Intelligence technology have led to the development of AI-based financial advisory systems. Financial advisory systems make use of machine learning and natural language processing techniques to analyze data and provide personalized advice to users. AI chatbots are increasingly being integrated into banking and financial institutions to help users with their spending and financial planning.
The recent advancements in financial advisory systems include AI features such as expense prediction and anomaly detection. However, these financial advisory systems are still evolving and lack transparency and customization options. In addition, these AI-based financial advisory systems are complex and not easily accessible to all users.

2.6 Limitations of Existing Systems

Based on the review of the existing literature, the following limitations of the existing system can be identified:

- Lack of integration between different financial modules such as expense tracking, budgeting, and EMI calculation
- Lack of personalization and smart recommendations
- Too much reliance on manual data entry
- Lack of support for comprehensive financial planning
- Lack of user-friendly AI-based guidance in many financial modules

2.7 Research Gap

The examination of existing systems indicates a research gap in the availability of a comprehensive platform that offers a fusion of financial tracking and intelligent advisory tools. There is a need to develop a system that does not only track financial information but also analyzes this information to provide insightful information.
The proposed AI Finance Tracker system aims to bridge this gap by incorporating features like expense tracking, budget planning, EMI tracking, and an intelligent chatbot within a single platform to improve the overall user experience and provide better financial decision-making.

CHAPTER 3: FRONT-END, BACK-END AND SYSTEM REQUIREMENTS

3.1 Overview of System Architecture

The system architecture of the proposed AI Financial Assistant is based on a modular approach, which includes the front end, back end, and data storage. This approach is more scalable and efficient in terms of system performance and maintenance. The system architecture is based on a client-server model with the front end, back end, and data storage. This is a well-structured approach, which can easily accommodate other modules.

3.2 Front-End Design

The front-end of the AI Financial Assistant is built in a manner that ensures a simple, intuitive, and user-friendly interface. This enables the user to interact easily with the different modules of the application.

3.2.1 Technologies Used

- Streamlit (used for building interactive web applications)
- HTML/CSS (used for designing the user interface)
- Python (used for integration with the back end)

3.2.2 Key Features of Front-End

User Authentication Interface:

User authentication interface is the part of the application where users can log in or register themselves to use the application securely.

Expense Tracker Interface:

In the expense tracker interface of the application, users can record their expenses on a daily basis along with the date, category, description, type, etc.

Budget Planner Interface:

In the budget planner interface of the application, users can create their own budgets or use the application's artificial intelligence to create their own budget plans.

EMI Tracker Interface:

In the EMI tracker interface of the application, users can manage their loans along with the EMI paid, the due date of the EMI, the balance remaining, etc.

Reports Dashboard:

In the reports interface of the application, users can view their financial reports through charts or other visual representations.

AI Financial Advisor (Chatbot):

In the application's chatbot interface, users can get their own personalized financial advice.

3.2.3 UI/UX Design Considerations

Dark theme for better readability

Simple navigation panel for easy access to the modules

Responsive web design for different screen sizes

Simple and minimalistic layout for a better user experience

3.3 Back-End Design

The back-end handles all the business logic, data processing, and communication between the front-end and the database. It makes sure that all the features work smoothly.

3.3.1 Technologies Used

- Python (core backend logic)
- SQLite (for data storage)
- GROQ API (for chatbot and AI-based recommendations)

3.3.2 Functional Modules

Authentication Module:

This module deals with user registration, validation of the user during the login process, and managing sessions.

Expense Management Module:

This module deals with storing, retrieving, and managing user expenses while calculating the total amount spent.

Budget Management Module:

This module deals with budget creation by the user, comparing user expenses with budgets, and suggesting budgets using AI.

EMI Management Module:

This module deals with managing loans, calculating the remaining balance, and managing EMI.

Reporting Module:

This module deals with consolidating all the data and displaying it in a summarized manner using graphical representation.

AI Financial Advisor Module:

This module deals with AI model analysis of user data and suggesting information regarding saving, budgeting, and spending.

3.4 System Requirements

3.4.1 Hardware Requirements

- Processor: Intel i3 or higher
- RAM: Minimum 4 GB (8 GB recommended)
- Storage: At least 500 MB free space
- Internet connection for AI features

3.4.2 Software Requirements

- Operating System: Windows / Linux / macOS
- Programming Language: Python 3.x
- Framework: Streamlit
- Database: SQLite
- IDE: VS Code / PyCharm
- Web Browser: Chrome / Edge / Firefox

3.4.3 Functional Requirements

- User registration and login
- Add, update, and delete expense records
- Budget creation and tracking
- EMI tracking and management
- Dashboard for financial visualization
- AI-based financial recommendations

3.4.4 Non-Functional Requirements

Security: The system should be able to provide proper safety in the storage of user data as well as proper authentication of the data.

Usability: The application should be able to provide a simple, intuitive, and user-friendly interface so that users of all levels of expertise will be able to easily use the application without any problems.

Performance: The system should be able to respond quickly to user interactions, including data input, calculations, and report generation.

Scalability: The system should be able to handle more users as well as more financial data without any problems.

Reliability: The application should be able to perform without any problems or failures.

3.5 Summary

In this chapter, the architecture and design of the AI Financial Assistant, as well as the front-end, back-end, and system requirements, have been explained. The inclusion of an interactive interface, efficient back-end, and AI-based features makes this system a comprehensive tool for managing individual finances.

CHAPTER 4: Methodology

4.1 Topic of the Work

The project, "AI Financial Assistant," is a smart personal finance management system. This project is created to assist users in managing their personal finance activities more efficiently. The project includes various features, including authentication, expense tracking, budget planning, EMI tracking, report dashboards, and AI-powered financial advisors.

The primary purpose of the project is to provide a single platform through which users are not only able to track their financial activities but are also provided with smart analysis of the data, thereby making efficient decisions through the integration of Artificial Intelligence, as it provides personalized financial advice based on user behavior.

4.2 System Design / Architecture

The AI Financial Assistant follows a modular layered architecture, ensuring clear separation of components and scalability.

4.2.1 Architecture Overview

The system is divided into three main layers:

1. **Presentation Layer (Front-End)**
    - Built using Streamlit
    - Handles user interaction and interface rendering
2. **Application Layer (Back-End Logic)**
    - Processes user inputs
    - Implements business logic
    - Integrates AI functionalities
3. **Data Layer (Database)**
    - Stores user data, expenses, budgets, and EMI details
    - Ensures data persistence and retrieval

Fig. 4.1: System Architecture Diagram

Description:

The architecture shows how the front-end interface, backend processing modules, AI engine, and database interact with each other. The user interacts with the front-end interface, which in turn interacts with the backend modules. The backend modules process the request and interact with the AI module for generating recommendations and the database for storing and retrieving data.

4.2.2 Module-Wise Design

- **Authentication Module**

  Manages user login and registration, storing encrypted user credentials.

- **Expense Tracker Module**

  Manages daily expense tracking, categorization, and storage.

- **Budget Planner Module**

  Enables both manual and AI-assisted budget planning.

- **EMI Tracker Module**

  Manages user loan tracking and instalment payments.

- **Report Dashboard Module**

  Shows users financial information through charts and report summaries.

- **AI Financial Advisor Module**

  Shows users financial advice through AI, using their financial information.

4.3 Working Principle

The working principle of the AI Financial Assistant is as follows:

4.3.1 User Registration and Login

Users are required to register by providing necessary information such as username, password, income, and savings goals. The provided information is saved in the database securely. Users can then log in to the system.

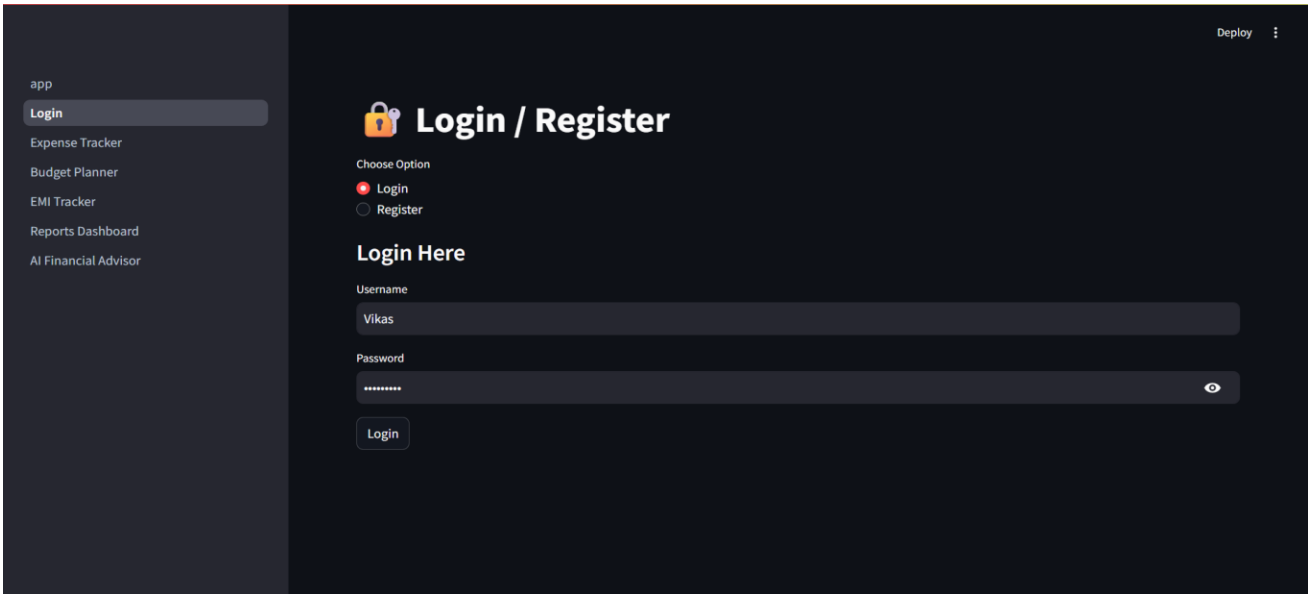

Fig. 4.2: User Login

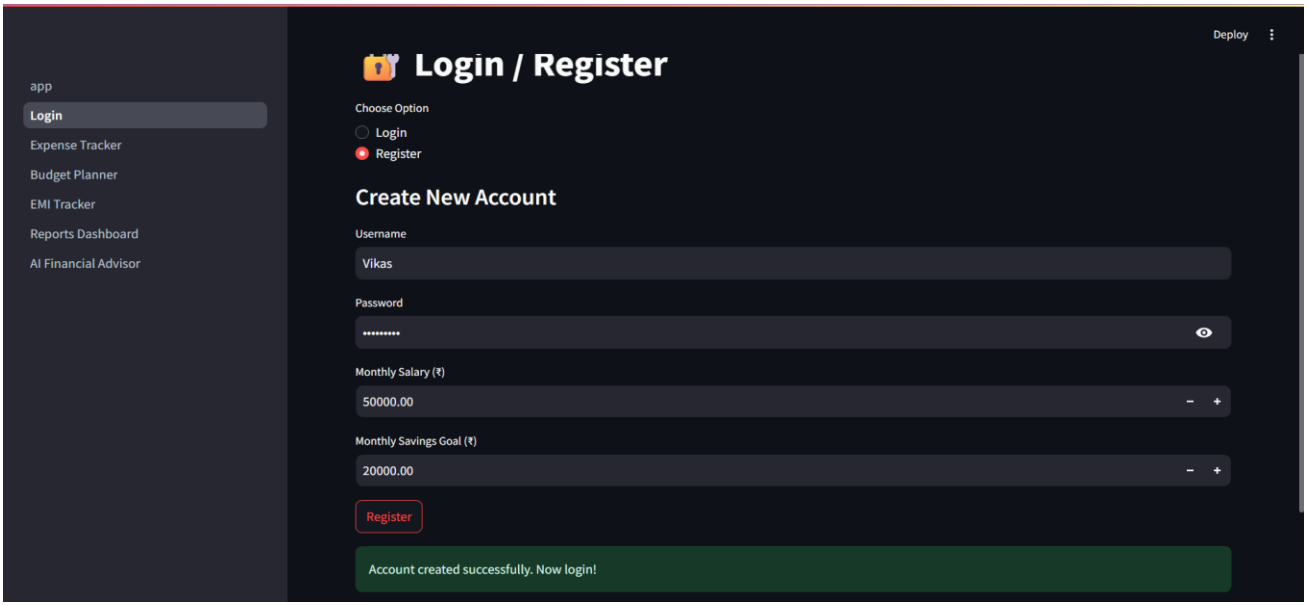

Fig. 4.3. Registration Interface

Description:

This interface helps in secure authentication of the users.

4.3.2 Expense Tracking Process

Users can input their expense information such as date, category, description, type, and expense value. The system stores the information and displays the total expenses dynamically.

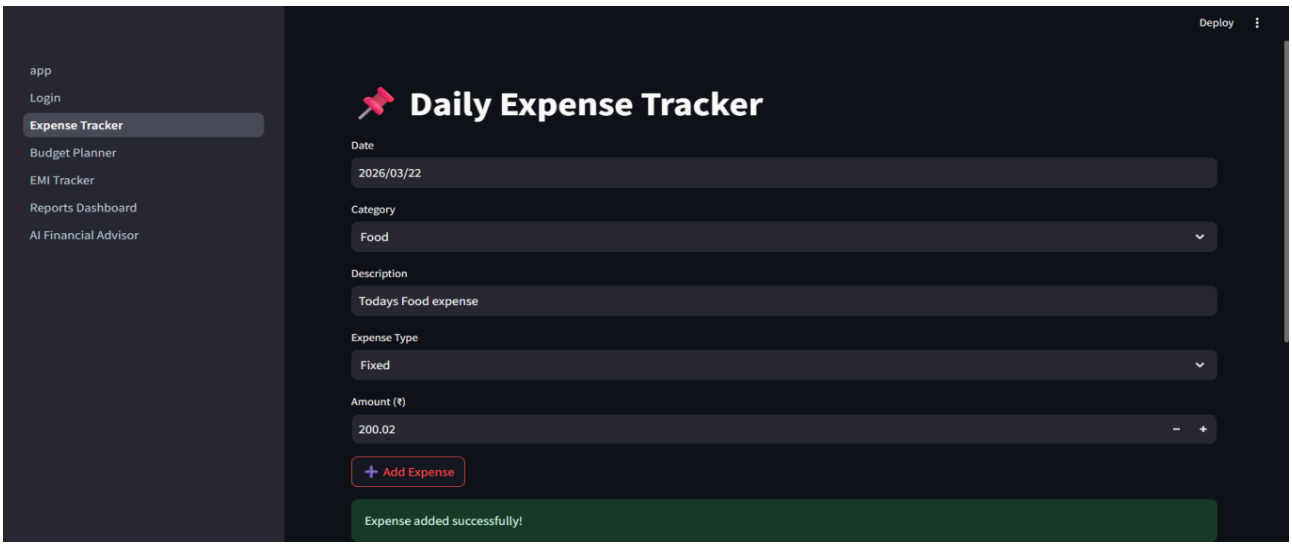

Fig. 4.4: Daily Expense Tracker

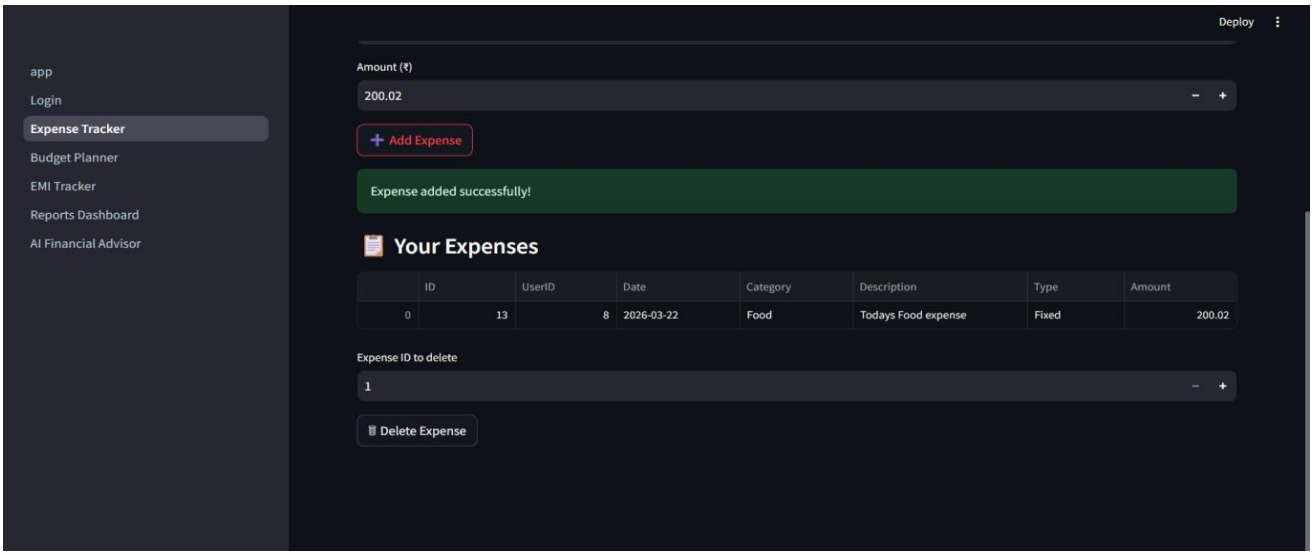

Fig. 4.5: Expense Records Interface

Description:

This module enables users to record their daily expenses efficiently.

4.3.3 Budget Planning Process

Users can set budgets manually or generate AI-based budget plans using inputs such as income, past expenses, and savings goals.

Fig. 4.6: Budget Planner Interface

Fig. 4.7: AI Budget Generation Interface

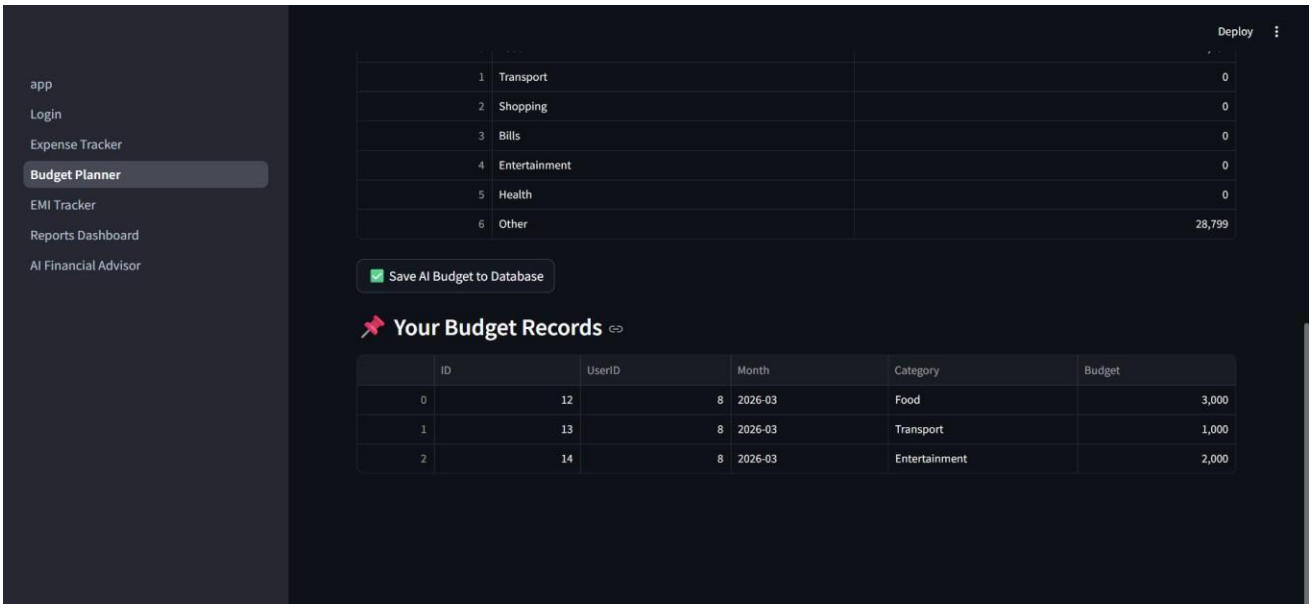

Fig. 4.8: Budget Records Interface

Description:

This module helps users allocate funds effectively and manage spending.

4.3.4 EMI Tracking

The users can enter their loan information like EMI, due dates, and tenure.

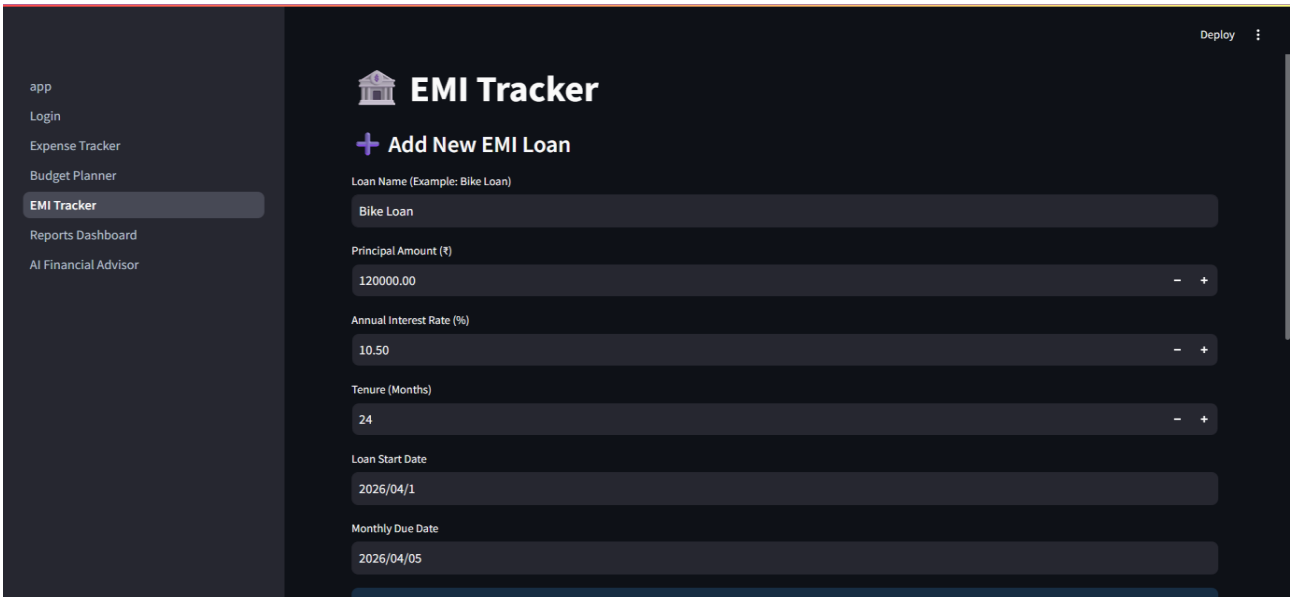

Fig. 4.9: EMI Tracker Interface

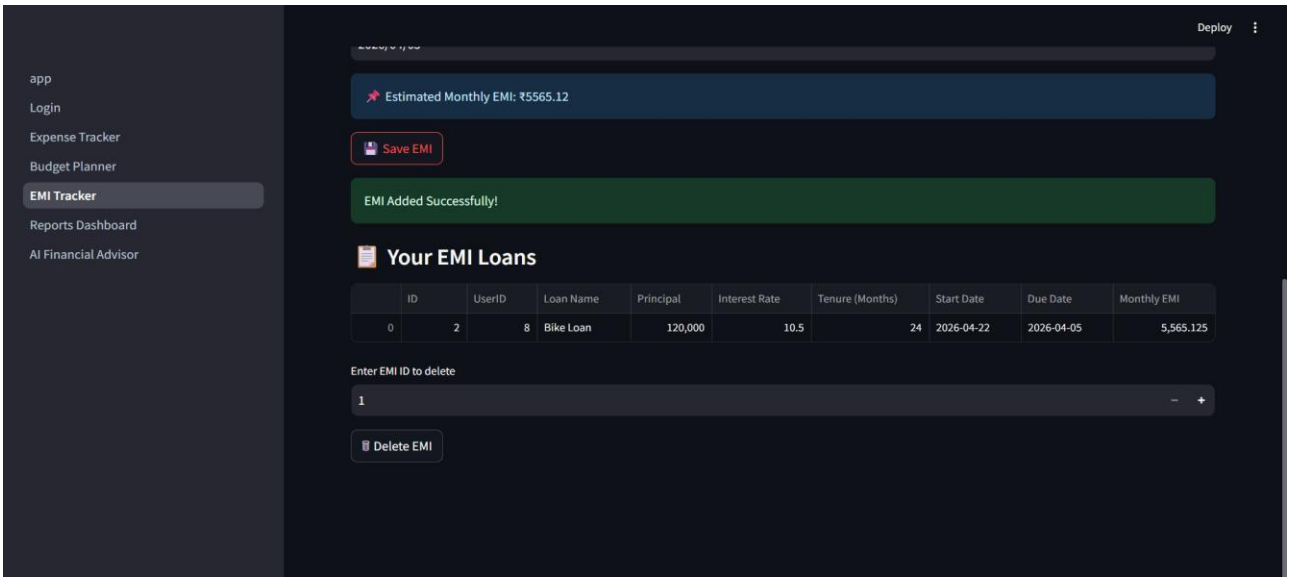

Fig. 4.10: EMI Records Interface

Description:

The module allows users to manage their loans and repayment schedules in an efficient way.

4.3.5 Report Dashboard

The system generates reports and visualizations including expense distribution, monthly trends, and budget comparisons.

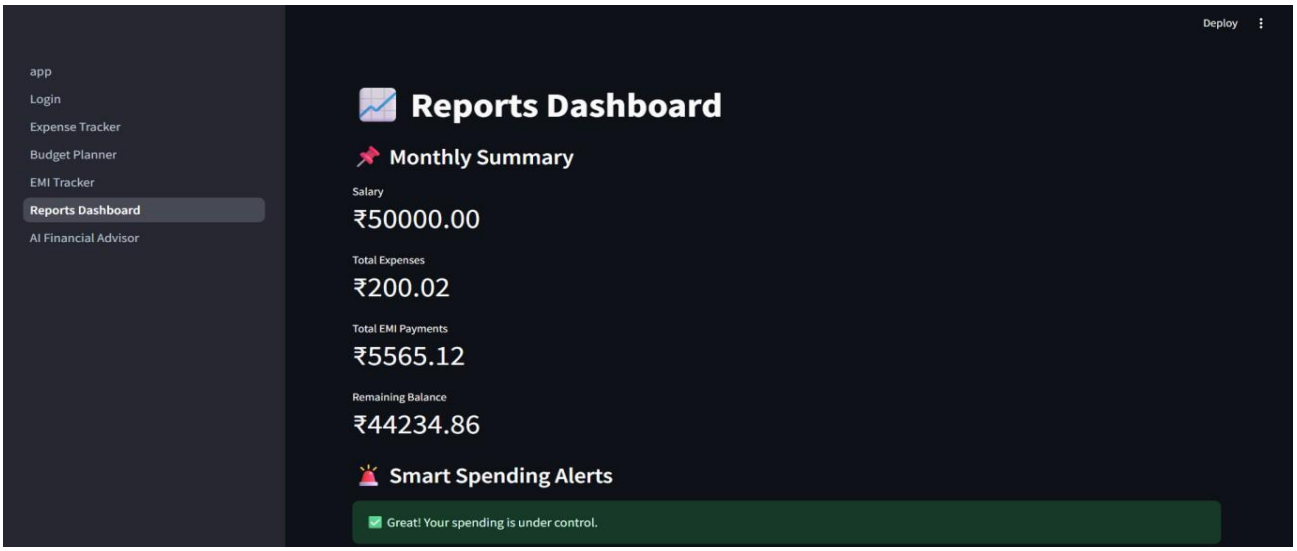

Fig. 4.11: Reports Dashboard

Description:

Provides graphical insights for better financial analysis and decision-making.

4.3.6 AI Financial Advisor

The AI module analyses user data and provides recommendations on savings, spending, and budgeting through a chatbot interface.

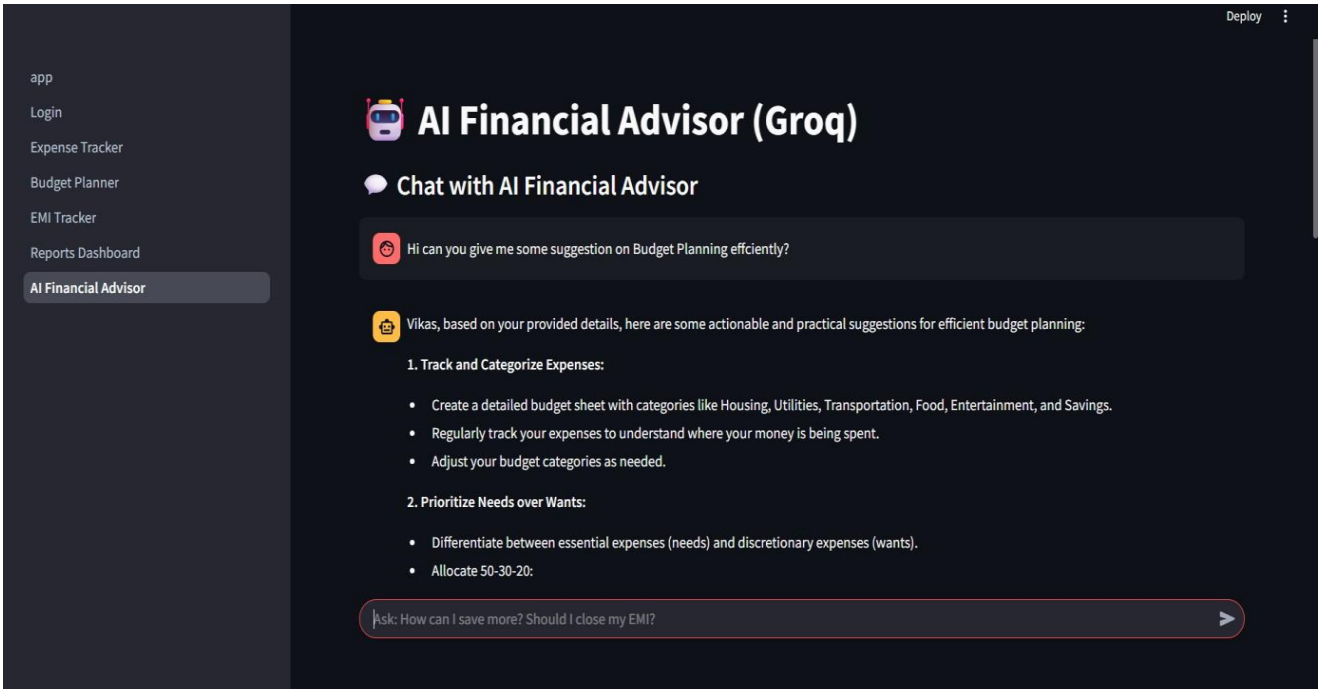

Fig. 4.12: AI Financial Advisor Chatbot

Description:

The chatbot delivers personalized financial advice and answers user queries intelligently.

4.4 Results and Discussion

The AI Financial Assistant was successfully implemented and tested with multiple users.

4.4.1 Observations

- Efficient tracking of expenses by the users
- Financial discipline through budget planning
- Optimization of savings through AI recommendations
- Financial understanding through dashboard visualization

Table 4.1: Feature Comparison with Existing Systems

Feature	Existing Systems	AI Financial Assistant
Expense Tracking	Yes	Yes
Budget Planning	Yes	Yes
EMI Tracking	Limited	Yes
AI Financial Advisor	No / Limited	Yes
Integrated Platform	No	Yes
Data Visualization	Basic	Advanced

4.4.2 Performance Analysis

- Fast response time for user inputs
- Efficient data storage and retrieval
- Smooth and interactive UI using Streamlit
- 4.4.3 Advantages of the System
- All-in-one financial solution
- AI-based insights and recommendations
- User-friendly and intuitive
- Real-time data updates and analysis

4.4.4 Limitations

- Internet connectivity necessary
- Manual data entry
- Basic AI implementation
- 4.5 Individual Contribution

4.5 Individual Contribution

Member 1: Ayan Ahmad

Ayan Ahmad contributed significantly to the development of the overall system design and backend development of the AI Finance Tracker. He was majorly in charge of the design of the architecture of the system, which entailed the development of the overall functionalities of the system, including the expense tracking module, budget planning module, and EMI tracking module. He ensured that the modules were logically organized and connected in the most efficient manner.

He also contributed significantly to the development of the system, especially the integration of the AI technology, especially the AI Financial Advisor. He ensured that the chatbot provides context-aware financial suggestions. He also contributed significantly to the debugging of the backend of the system.

Member 2: Kamal Yadav

Kamal Yadav was responsible for the front-end development of the application using Streamlit. They worked on developing an intuitive and visually appealing user interface for the application, which improves the user experience. This involved designing the login/register pages, expense tracker forms, budget planner interfaces, etc.

They worked on ensuring the application had a consistent theme, i.e., it is in dark mode, and it had a clean layout for easy navigation through the application. They worked on making the UI responsive and also validated the inputs and user interactions, making it user-friendly and efficient for real-time usage.

Member 3: Aditya Vikram Singh

The task allocated to Aditya Vikram Singh was to handle the database design and management of the system. This included designing database schemes to store data for users, their expenses, budgets, and EMI information. They also took care of proper data structuring to maintain data consistency.

Moreover, they worked on providing an efficient query system to enable quick data access and updation. They also worked on data validation and integrity to avoid data redundancy and provide accurate financial data. This was an essential task to provide a reliable data storage system and smooth backend operations.

Member 4: Saurabh Kumar

Sourabh Yadav was responsible for testing and debugging the application. He carried out extensive functional testing on all the modules, including authentication, expense tracking, budget planning, EMI tracking, and AI advisor.

He identified the bugs in the system and fixed them, which enhanced the stability of the system. In addition, he tested the system for all the possible scenarios, including invalid inputs, which enhanced the robustness of the system. This ensured a reliable and error-free user experience.

Member 5: Tanweer Iqbal

Tanweer Iqbal helped with the documentation process, report writing, and system integration. The responsibilities included writing the project document with chapters, diagrams, etc.

They also helped with the integration of different modules of the project so that all the components of the system worked together properly. They also helped with the preparation of the project presentation, screenshots, etc., which would be required to submit the final project.

4.6 Summary

This chapter discussed the methodology adopted in the development of the AI Finance Tracker. It included the system architecture, working principle, implementation, and results obtained.

The AI Finance Tracker was developed based on a modular structure comprising the front-end, back-end, and database layers. The working principle discussed the interaction of various modules of the AI Finance Tracker, thereby providing a seamless user experience.

The results and discussion section discussed the results obtained from the AI Finance Tracker in managing personal finances effectively. The various features of the AI Finance Tracker, including expense tracking, budget planning, EMI tracking, and AI, are beneficial for users. The AI Finance Tracker not only tracks the user's spending but also analyses it, thereby providing meaningful insights.

Moreover, the project was successful in overcoming the limitations of existing systems by providing an all-in-one solution with intelligent capabilities. Although it has some limitations, including the need to manually feed data into the system and the basic AI capabilities, it provides a good foundation for further development.

In conclusion, the AI Finance Tracker is a real-life example of the application of software development and artificial intelligence to address the problem of financial management. The collaborative efforts of the team made the project a success.

CHAPTER 5: Conclusion

5.1 Introduction

This chapter includes the final results of the AI Finance Tracker project, as well as the visual representation of the project in the form of screenshots. The project has successfully demonstrated the capabilities of modern technologies, combined with Artificial Intelligence, in simplifying personal finance management.

5.2 Screenshots and Explanation

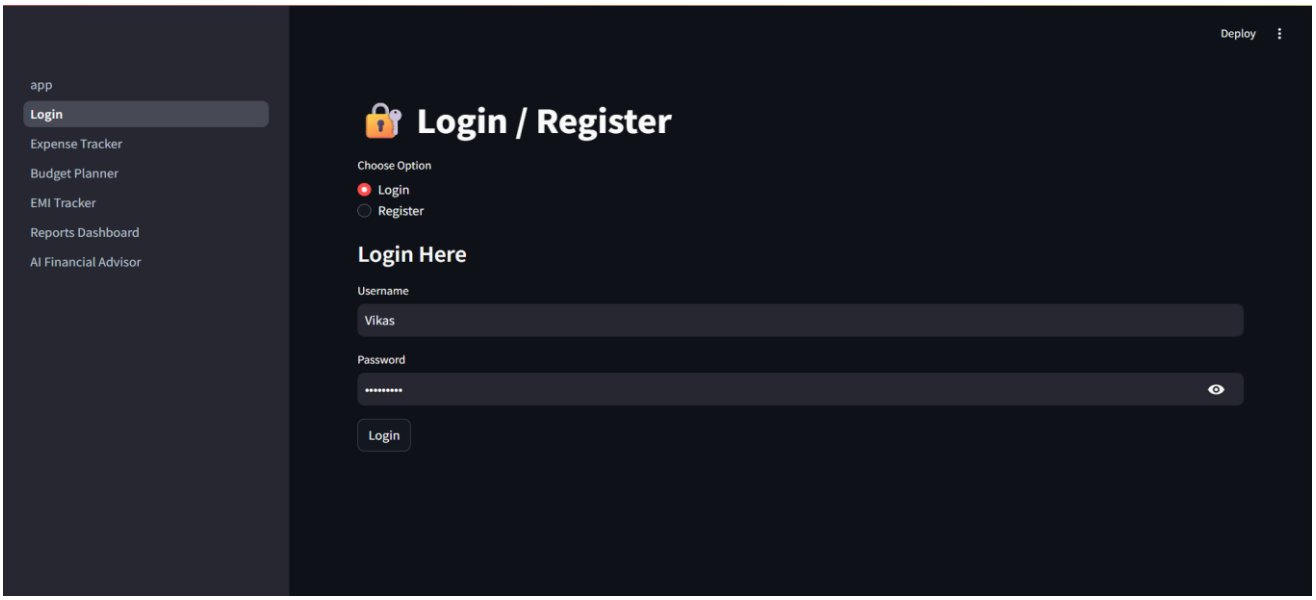

Fig. 5.1: Login Interface

Explanation:

The above figure illustrates the "Login Interface" of the "AI Financial Assistant" system. The "Login Interface" allows users to access the system by entering their user's name and password. The interface ensures the proper authentication of users, thus protecting their information. The interface is simple, making the process easy and efficient.

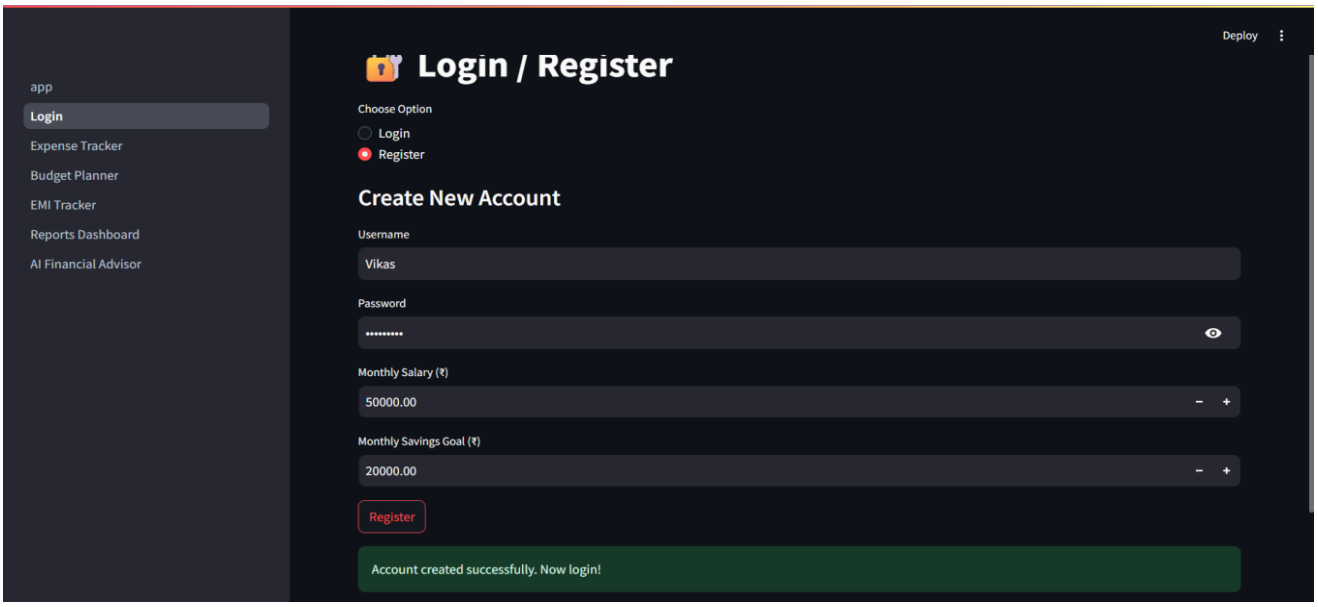

Fig. 5.2: Registration Interface

Explanation:

The above diagram indicates a screenshot of the Registration Interface of the AI Financial Assistant system. This interface enables a new user to register and create an account with the system by entering their details like username, password, salary, and savings goal. The system stores this information and allows users to access their personalized financial tools. The interface is quite simple and easy to use.

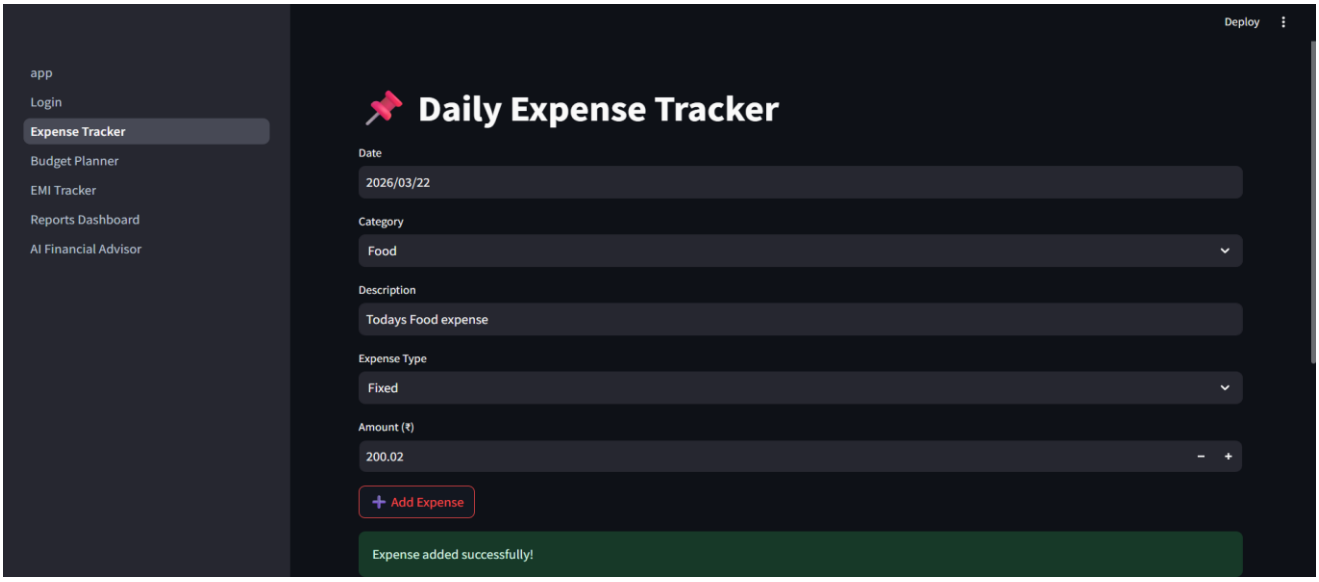

Fig. 5.3: Expense Tracker Interface

Explanation:

The above figure shows the Expense Tracker Interface of the AI Financial Assistant system. This module allows users to track their daily expenses by entering the required information, including date, category, description, expense type, etc. The information entered by the user is saved by the system,

making it easy to track the spending habits of the user. The interface is simple, making it easy to manage the financial transactions of the user.

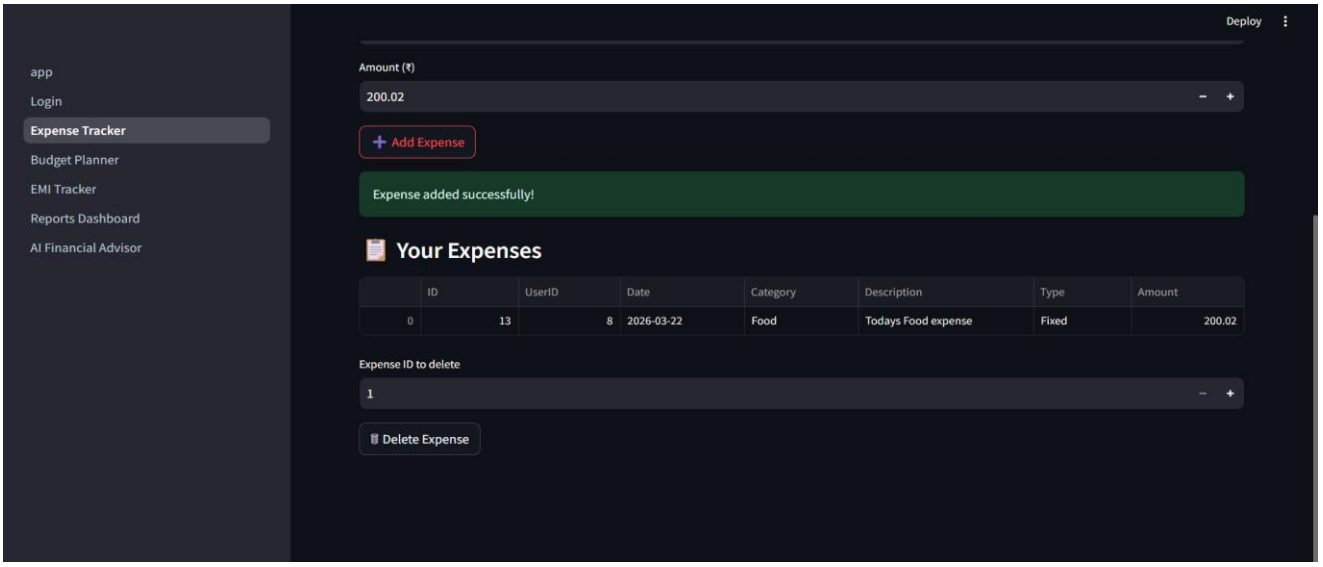

Fig. 5.4: Expense Records Interface

Explanation:

The figure above illustrates the Expense Records Interface of the AI Financial Assistant system. This interface shows the list of recorded expenses in a structured tabular form, including details such as date, category, description, type, and amount. Additionally, there is a facility to delete specific expense records, making it easy for the user to manage and update their financial records.

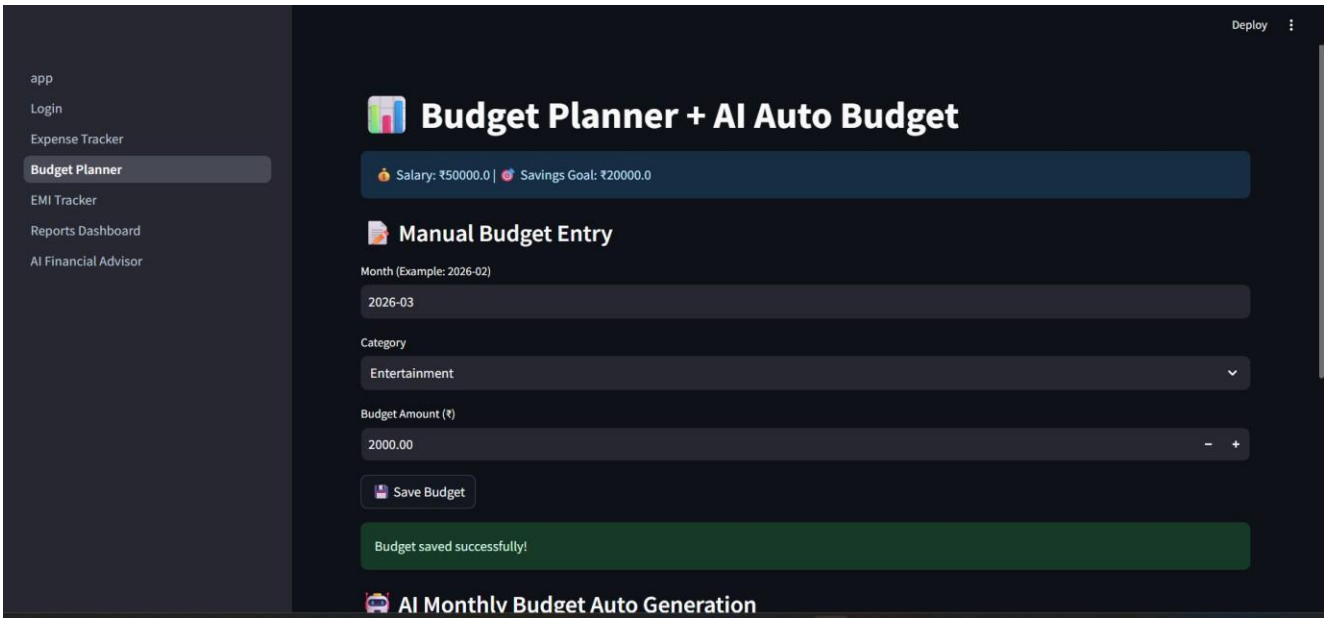

Fig. 5.5: Budget Planner Interface

Explanation:

The above figure depicts the Budget Planner Interface of the AI Financial Assistant. This module enables the user to create budgets for various categories of expenditure by entering details like month, category, and budget. Additionally, the module enables the user to generate a budget through AI technology using income and savings goals. This system enables the user to plan their expenditure effectively and have better control over it.

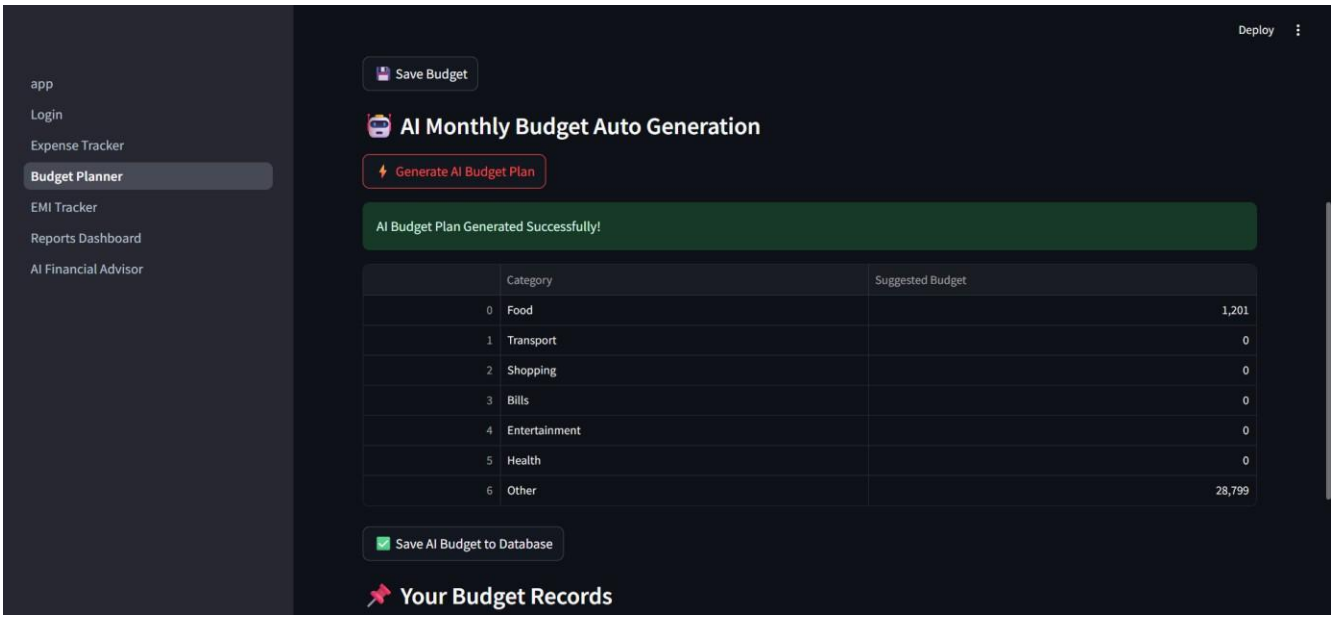

Fig. 5.6: AI Budget Generation Interface

Explanation:

In the above image, the interface of the system named 'AI Budget Generation Interface' is shown. This is the interface of the 'AI Financial Assistant' system through which the system generates a monthly budget plan on the basis of the inputs given to the system, such as the salary of the user or the saving goals of the user. The system allocates the budget to different categories such as food, transport, etc.

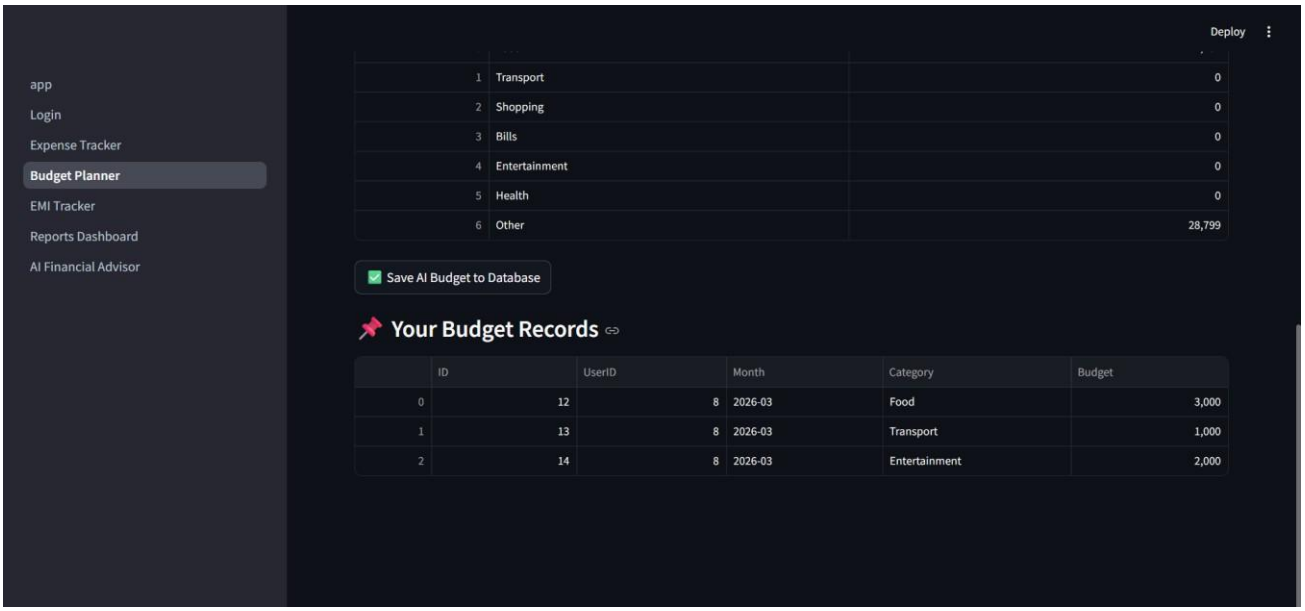

Fig. 5.7: Budget Records Interface

Explanation:

The above figure shows the Budget Records Interface of the AI Financial Assistant system. This module shows the saved budget data in a structured table format, including fields such as user ID, month, category, and budget amount. This helps the users review their planned budgets effectively, thus gaining better control over their spending.

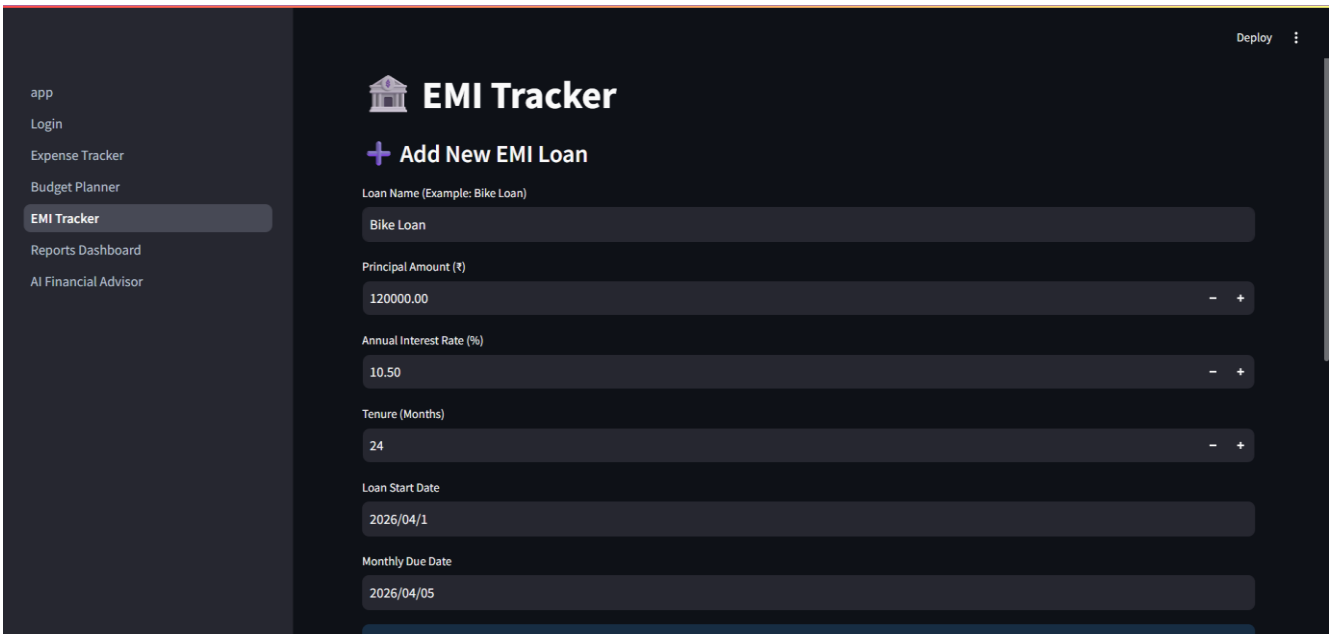

Fig. 5.8: EMI Tracker Interface

Explanation:

In the above diagram, the EMI Tracker Interface is shown for the AI Financial Assistant system. This interface enables users to input information such as the name of the loan, the principal amount, the interest rate, the tenure of the loan, and the date when the loan is to be started. This information is then utilized by the system to manage the EMI payments made on the loans.

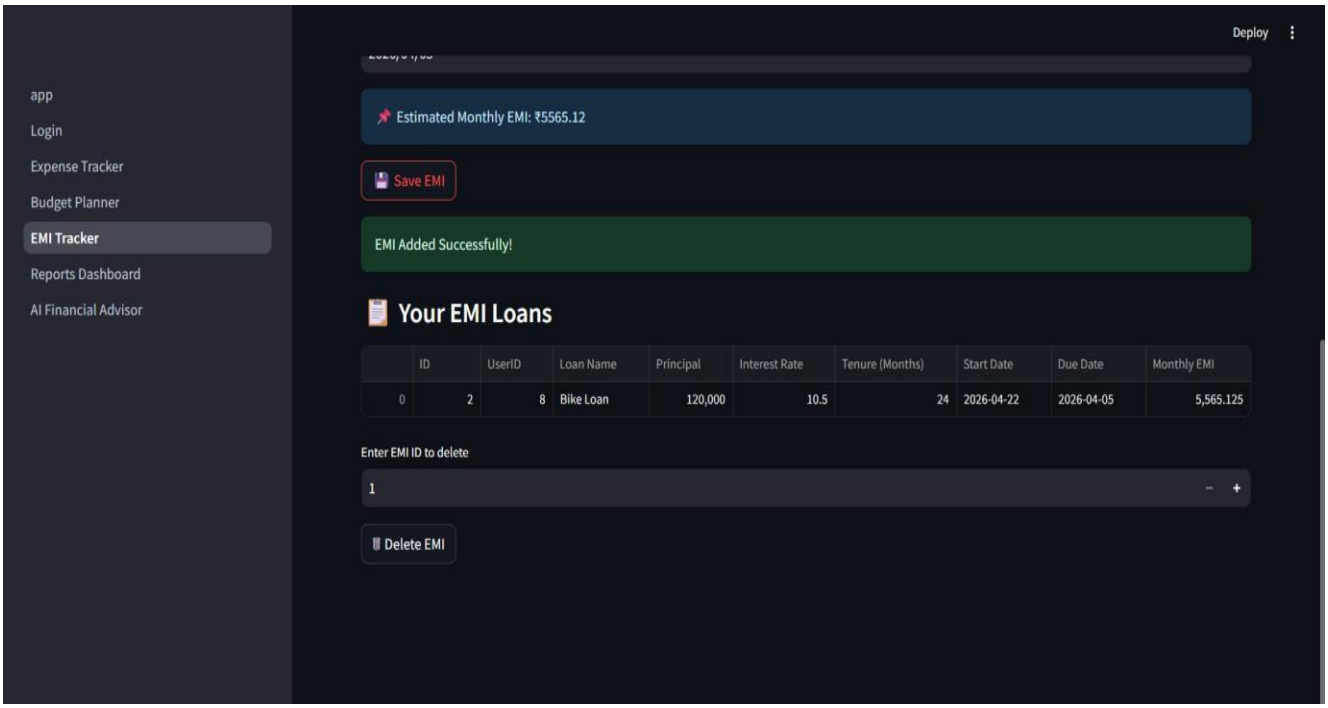

Fig. 5.9: EMI Records Interface

Explanation:

The above figure indicates the interface for the EMI Records, which belongs to the AI Financial Assistant system. The interface presents the stored information regarding the loan from EMI in a structured format, as shown below. The information includes the name of the loan, the principal amount, the rate of interest, the tenure, the start date, the due date, and the monthly installment. There is a provision to delete the EMI records as well.

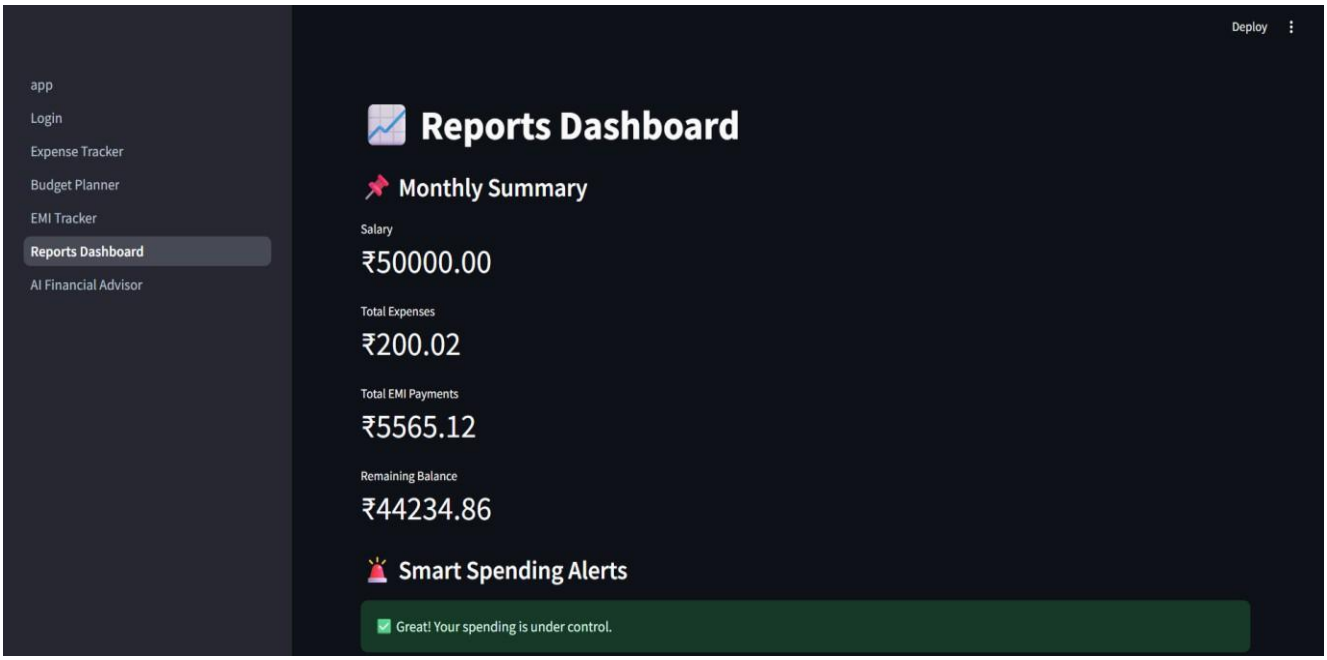

Fig. 5.10: Reports Dashboard

Explanation:

The above figure depicts the Reports Dashboard Interface of the AI Financial Assistant system. This module gives a summary of the user's financial status, including the user's salary, total expenses, EMI payments, the balance left, and smart spending alerts. This dashboard assists the user in getting a quick idea of their financial

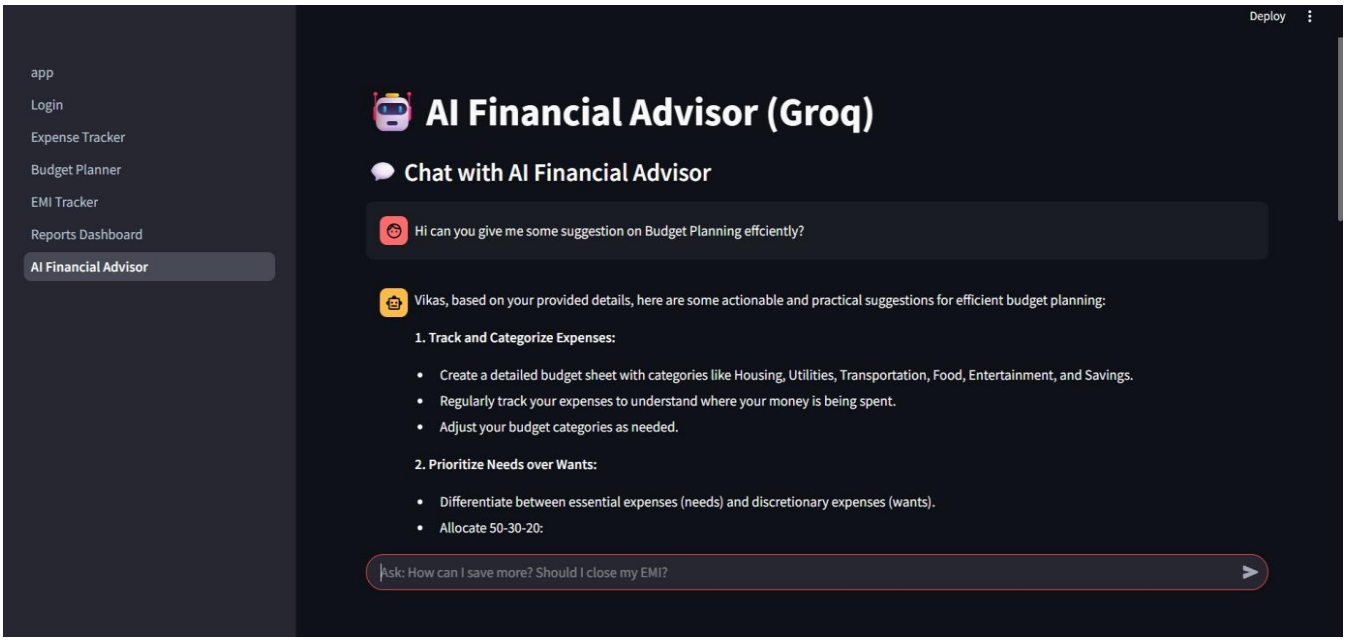

Fig. 5.11: AI Financial Advisor

Explanation:

The AI Financial Advisor interacts with users through a chatbot interface. It provides personalized financial advice, such as saving strategies, budget optimization, and expense analysis based on user data.

5.3 Final Outcome of the Project

The AI Finance Tracker project was successfully designed and implemented as a comprehensive financial management system. The final outcome of the project can be summarized as follows:

- A fully functional web-based application was developed using Streamlit.
- The system integrates multiple financial management features into a single platform.
- Users can track expenses, plan budgets, monitor EMIs, and visualize financial data.
- The AI-powered chatbot enhances the system by providing intelligent financial advice.
- The application ensures a user-friendly interface and smooth navigation across modules.

The project achieved its primary goal of simplifying personal finance management while incorporating modern AI techniques to improve decision-making.

5.4 Conclusion

In conclusion, the AI Finance Tracker provides an efficient and intelligent solution for managing personal finances. The integration of multiple modules such as expense tracking, budget planning, EMI tracking, and AI advisory makes it a powerful and comprehensive tool.

The project demonstrates how technology can be leveraged to solve real-world problems by improving financial awareness and helping users make informed decisions. The use of AI adds significant value by providing personalized insights, which traditional systems often lack.

Although the system performs effectively, future improvements such as bank integration, mobile application support, and advanced AI models can further enhance its capabilities.

Overall, the AI Finance Tracker is a successful implementation of a smart financial management system and serves as a strong foundation for further development and real-world deployment.
